LAKE HISTORY

GENERAL INFORMATION

Shoreline length
3.4 miles

Average depth
5 feet

Maximum depth
10 feet

Natural seasonal water fluctuation
1 to 2 feet

Parish
Jackson

Date Lake formed
1952

Impoundment
Edwards Branch (tributary of Castor Creek)

Size (surface area)
158 acres

Watershed
10,229 acres drain into Chatham Lake.
The ratio of watershed to lake surface is large at 64.7 to 1.
Watershed characteristics: Commercial pineland forest, upland hardwood, pasture, rural residential. Soil is acidic, sandy, and infertile. Soil alkalinity and pH are low.

Pool Stage
Surface elevation of Chatham Lake is set at the spillway weir elevation of 165 MSL.

Spillway width
Spillway dam structure – total weir length – 150 feet.

Drawdown description
Gate Size – 18” slide gate with 18” diameter pipe
Number of gates - 1
Condition – good – new gate installed August, 2007
Who controls
Louisiana Department of Transportation and Development is responsible for the maintenance and operation of the Chatham Lake spillway.

LAKE AUTHORITY

Association
The Jackson Parish Watershed District shall consist of seven commissioners, each of whom shall be a qualified elector of the State of Louisiana who resides within the limits of Jackson Parish. The commissioners shall be appointed by the Jackson Parish Police Jury and serve terms of 4 years and until their successors have been appointed and have been qualified. The members are listed in Table 1. Any vacancy in the office of commissioner, due to death, resignation or any other cause shall be filled by an appointment of the Jackson Parish Police Jury.

Table 1. Members of Jackson Parish Watershed District Board of Commissioners as of January 2014.

Authorization
JPWD created in 1972 by LA R.S. 38:2900 as political subdivision and budgetary unit. LA R.S. 38:2900 creates the Jackson Parish Watershed District, out of the watershed of all streams located in Jackson Parish, and more particularly defined as all of Jackson Parish, Louisiana. The Jackson Parish Watershed District shall be an agency of the State of Louisiana and a budgetary unit thereof, which shall have as its purpose the conservation of soil and water, developing the natural resources and wealth of the district for sanitary, agricultural and recreational purposes, as the same may be conducive to the public health, safety, convenience or welfare or of public utility or benefit of the citizens of the State of Louisiana.

The Jackson Parish Game and Fish Preserve purchased property and acquired servitudes for
the creation of Chatham Lake for a recreational fishery.

ACCESS

Boat Docks
The Chatham Public Boat Ramp is open to the public and is free of charge. The concrete ramp was renovated in late 2007. The location of the ramp is indicated on map in APPENDIX I.

Piers
There are a few (<5) privately owned piers associated with shoreline properties. One public fishing pier was constructed on the south side of the lake in 2006 (Figure 1).

Figure 1. Public fishing pier on Chatham Lake, LA.

State/Federal facilities
Two picnic areas were constructed in 2006.

SHORELINE DEVELOPMENT

The Chatham Lake shoreline is primarily residential, but lightly developed. No commercial marinas are in operation.
EVENTS / PROBLEMS

Chatham Dam Leakage
July, 1998 - Letter from Mr. Mike Aghayan, Chief of DOTD Dam Safety, indicated that Chatham Lake Dam required immediate attention. DOTD personnel that inspected the dam were not able to determine the extent of damages. They suspected that the metal sliding gate (approx. 3’ X 3’) had deteriorated and was leaking (Figure 2). Funding was secured for the repairs by Rep. Jim Fannin through Rural Development Funds in 2006. The spillway gate was replaced in 2007.

Because a drawdown was required for spillway repairs, renovation of the existing fish population and improvements to the boat ramp were planned to coincide with the project.

Figure 2. Control structure on Chatham Lake, LA prior to repairs being performed in 2007.
MANAGEMENT ISSUES

AQUATIC VEGETATION

Complex Cover in Chatham Lake consists of aquatic vegetation and bald cypress (*Taxodium distichum*) trees. The upper half of the lake is shallow with scattered cypress trees in the center of the lake and patches of aquatic vegetation that transition to a cypress forest near the headwaters (Figure 3). Much of the timber on the lower half of the lake was cut prior to impoundment. Therefore, complex cover in this part of the lake can only be found in the littoral zone and consists of a fringe of emergent vegetation and cypress trees.

Figure 3. Typical habitat in the upper end of Chatham Lake, LA.
The upper half of Chatham Lake is very shallow (less than 3 feet) and aquatic vegetation has been problematic for many years. Historically, the shallow water areas of the lake are covered annually with submerged aquatic vegetation including fanwort (*Cabomba caroliniana*), bladderwort (*Utricularia spp.*), coontail (*Ceratophyllum demersum*), parrot feather (*Myriophyllum aquaticum*), and naiad (*Najas spp.*). Common emergent vegetation present includes water primrose (*Ludwigia octovalvis*), alligator weed (*Alternanthera philoxeroides*), and water lily (*Nymphaea spp.*). Emergent vegetation is typically found in a fringe around the lake and intermingled with submerged vegetation throughout the shallow areas of the lake. Historically, water hyacinth (*Eichhornia crassipes*) and duckweed (*Lemna spp.*) have been the predominant floating plant species.

Common salvinia (*Salvinia minima*) was first observed in Chatham Lake in 2003 during observations made in conjunction with daytime electrofishing sampling. In August of 2004, it was observed to cover approximately 10 acres. Control efforts included foliar herbicide applications by LDWF spray crews and a three foot drawdown for habitat improvement in 2004. Common salvinia was not observed again until 2006. It is currently found in the lake but has not become problematic.

**Aquatic Vegetation Surveys**
Surveys to estimate aquatic vegetation coverage were performed in 2005, 2012, and 2013. The results of these surveys can be found in **APPENDIX II – Aquatic Vegetation Surveys**.

**Aquatic Vegetation Treatment History**
Foliar herbicide applications for control of nuisance aquatic vegetation are made periodically by LDWF spray crews. Herbicide applications made from 2006 through 2013 are listed in Table 2.
HISTORY OF REGULATIONS

Recreational
Statewide regulations have been in effect for all fish species, since the creation of the lake. Recreational fishing regulations may be viewed at the link below:
http://www.wlf.louisiana.gov/fishing/regulations

Commercial
Statewide regulations have been in effect for all fish species, since the creation of the lake. Commercial fishing regulations may be viewed at the link below:

DRAWDOWN HISTORY

Drawdowns were conducted in 1967 and 1975 for the purpose of aquatic vegetation control. A drawdown conducted in the fall of 2004 was for aquatic vegetation control, and for aeration of shallow substrate. The lake was completely dewatered in 2007 for repairs to the control structure and renovation of the lake. Details of the drawdowns are found in Table 3.

Drawdown Dates
Drawdowns conducted in fall – typically after Labor Day through mid winter.

FISH KILLS / DISEASE HISTORY, LMBV

No kills recorded due to poor water quality or toxins.

CONTAMINANTS / POLLUTION

Water quality

No fish consumption or swimming advisories issued.

BIOLOGICAL

Fish and aquatic vegetation sampling
The Louisiana Department of Wildlife and Fisheries has conducted standardized sampling on Chatham Lake beginning in 2002. Sampling has been increased following the renovation project in 2007. Sampling history and planned sampling through 2017 is listed in Table 4.

Lake records
The Louisiana Outdoor Writers Association (LOWA) is the official curator of fish records for the State of Louisiana. No lists are kept specifically for Chatham Lake. Complete information regarding Louisiana fish records is included in the attached site: http://www.laoutdoorwriters.com/Records/LouisianaFishRecords/tabid/87/Default.aspx

Stocking History
Prior to the lake renovation project in 2007, the dominate species stocked into Chatham Lake was channel catfish. The stocking history from 1971 to 2012 is found in Table 4.

**APPENDIX I**

*(return to access)*
Map of Chatham Lake indicating depths of points at pool stage.
L.D.W.F. Inland Fisheries personnel Ryan Daniel and Randy Lively performed a vegetation survey of Chatham Lake on August 22, 2005 for the purpose of constructing an aquatic type map. The lake level at the time of the survey was approximately 18 inches below pool stage due to evaporation and low amounts of rainfall. The east (spillway) end of the lake was mostly void of aquatic vegetation. There were some isolated water hyacinths on dry ground along the dam and around the fishing pier. There was also some alligator weed growing on the dam but not extending into the water. Filamentous algae was also observed growing in shallow water adjacent to the shoreline for much of the area around the dam but was not at problematic levels. Scattered small patches of alligator weed and water primrose were seen along the north and south banks in the mid portion of the lake. The majority of the vegetation in the lake is located on the western end which is mostly less than 3 ft. deep and scattered with clumps of cypress. Emerged vegetation includes water primrose and alligator weed forming large mats near the far west end. Submerged species include filamentous algae, small amounts of slender naiad, and scattered coontail. There was no submerged vegetation in water depths over 3 feet. The percent coverage for the western one-third of the lake is approximately 25%, not including the solid mat at the far west end. Only about 5% of the shoreline along the rest of the lake has any aquatic vegetation other than filamentous algae. Other than the extremely shallow west end, vegetation is very sparse in the lake, with the entire lake having between 5%-10% of both submerged and emergent vegetation. L.D.W.F. had sprayed for nuisance plants on within the past 60 days.

A survey of the aquatic vegetation on Chatham Lake was performed on 4-8-11. At the time of the survey, a mixture of submerged vegetation consisting primarily of bladderwort, fanwort, slender naiad, and coontail was found out to depths of 3 to 4 feet covering an area estimated at 40 acres. A fringe of emergent vegetation consisting primarily of red ludwigia was found along the shoreline of the lake, and the emergent vegetation extended out onto shallow flats in several areas, notably the upper end of the lake and around the fishing pier on the lower end of the lake.

In 2011, herbicide treatments were made on three occasions for salvinia control on Chatham Lake. Diquat was used at a rate of 0.75 gal per acre in addition to 1qt of surfactant comprised of 3 parts Aquaking and 1 part Thoroughbred. During an August 2011 assessment, there were minimal amounts of salvinia on the lake, but approximately 40% coverage of submerged vegetation was present.

Chatham Lake had undergone a complete drawdown for renovation purposes in 2007 which was
preceded by a partial dewatering of the lake in 2004 for habitat improvement. It is apparent that
drawdowns will only provide short term control of the submerged aquatic vegetation in the
shallow areas of the lake. Approximately 50% (75 acres) of Chatham Lake has water depths less
than 4 feet deep. This area is usually covered annually by submerged aquatic vegetation.

**Chatham Lake – Aquatic Vegetation Survey – 2013**

A survey of the aquatic vegetation on Chatham Lake was performed on 1-23-13. At the time of
the survey a fringe of common salvinia (*Salvinia minimum*) approximately 2-3 feet wide was
surrounding the majority of the shoreline on the lake. This would cover an area approximately 3-5
acres in size.

At the time of the survey in January 2013, submerged aquatic vegetation was sparse. Coontail
and southern naiad were present. Aquatic vegetation coverage on Chatham Lake was estimated
at less than 10%. Common salvinia was the main component of aquatic vegetation on Chatham
Lake.

A second assessment was conducted on 10/14/13. Common salvinia coverage had increased to
10-15 acres and was primarily located in the extreme upper end of the lake. Submerged aquatic
vegetation consisted of fanwort, coontail, and naiad species. Coverage of SAV was light in the
center of the lake and generally represented good fisheries habitat. Vegetation densities
increased near the shore where submerged vegetation was combined with fringe of emergent and
floating plants. Species included primrose, aligatorweed, hyacinths, and common salvinia.
Vegetation densities have remained fairly consistent on Chatham Lake for the past three growing
seasons with the exception of the late summer increases in common salvinia. Approximately
40% of Chatham Lake contained aquatic vegetation, but much of it was light in coverage and can
be viewed as a benefit for fisheries production.
