Kepler Lake – Aquatic Vegetation Type Map and Narrative - 1980

Kepler Lake August
1980

Kepler was under a drawdown when the survey was made. The lake was down four feet. The water was clear and no plankton bloom was noticed.

The major submersed plants listed in order of importance are Brazilian elodea (*Egeria densa*), and fanwort (*Cabomba caroliniana*). No other plants were observed during survey. Brazilian elodea (*Egeria densa*) covered an area at the dam and fanwort (*Cabomba caroliniana*) was observed in all other areas.

The major marginal plants were rush (*Juncus spp.*) and American lotus (*Nelumbo lutea*). American lotus (*Nelumbo lutea*) covered about a two acre area in about the middle portion of the lake.

At the time of the survey, Kepler has a severe plant problem.

Melvin Bagwell Aquatic Specialist

Above text transcribed from original document and corrected by James Seales, January 2012.
At the time of assessment and type map, Kepler Lake was at pool stages. The color of the water was murky. There was some algae bloom present. The reason for the color could be because of locally heavy rainfall.

The dam has a crack in it. I could not judge how badly damaged it is.

The submersed species noted were fanwort (Cabomba caroliniana), coontail (Ceratophyllum demersum), bladderwort (Utricularia spp.), Brazilian elodea (Egeria densa), and muskgrass (Chara spp.). There was a severe infestation in the extreme upper end which consisted of fanwort (Cabomba caroliniana), bladderwort (Utricularia spp.), and coontail (Ceratophyllum demersum), with the primary species being fanwort (Cabomba caroliniana) and bladderwort (Utricularia spp.). The light and moderate infestations consisted primarily of bladderwort (Utricularia spp.) and muskgrass (Chara spp.) with some fragments of fanwort (Cabomba caroliniana) in the mid-portion and with some fragments of Brazilian elodea (Egeria densa) in the area next to the dam. Some muskgrass (Chara spp.) was found in all areas.

There was an infestation of American lotus (Nelumbo lutea) in one area on the east side below the bridge.

The drawdown also got rid of some of the stumps in all areas. The lake as a whole has a lot less stumps.

Above text transcribed from original document presumably written by Melvin Bagwell and corrected by James Seales, January 2012.
At the time of assessment Kepler Lake was at pool stage. The color of the water was very clear. Some plankton blooms were noted in the upper portion of the lake.

The severe infestation as indicated on the type map, are comprised of fanwort (*Cabomba caroliniana*), milfoil (*Myriophyllum spp.*), bladderwort (*Utricularia spp.*), and filamentous algae.

The moderate infestations noted were comprised of fanwort (*Cabomba caroliniana*) and milfoil (*Myriophyllum spp.*).

The light infestations noted were comprised of bladderwort (*Utricularia spp.*), pondweed (*Potamogeton spp.*), filamentous algae and fragments of fanwort (*Cabomba caroliniana*).

There were no floating plants noted in Kepler Lake.

The emersed plants noted were American lotus (*Nelumbo lutea*), and they were in an area about one acre in size in the mid portion of the lake.

Marginal plants were fiddleleaf (*Hydrolea spp.*), buttonbush (*Cephalanthus occidentalis*), arrowhead (*Sagittaria spp.*), smartweed (*Polygonum spp.*), and miscellaneous grasses.

In summary Kepler Lake is in good condition. There has been no significant increase in submersed plants since last year. The emersed plants have decreased somewhat. Marginal plants have not increased and they are in tolerable numbers.
At the time of assessment Kepler Lake was at pool stage. There was little plankton bloom noted in any area. Some filamentous algae was noted in almost all areas.

The severe infestations as noted on the type map were comprised of fanwort (*Cabomba caroliniana*), milfoil (*Myriophyllum spp.*), coontail (*Ceratophyllum demersum*), and bladderwort (*Utricularia spp.*). In almost all areas the aforementioned plants were mixed in the infestation.

The moderate infestations consisted of fanwort (*Cabomba caroliniana*), coontail (*Ceratophyllum demersum*), and bladderwort (*Utricularia spp.*).

The light infestations consisted of fanwort (*Cabomba caroliniana*), bladderwort (*Utricularia spp.*), and pondweed (*Potamogeton spp.*). In some areas of light infestation the plants were fragmented.

The marginal plants noted were buttonbush (*Cephalanthus occidentalis*), willow (*Salix spp.*), spikerush (*Eleocharis spp.*), bald cypress (*Taxodium distichum*), cattail (*Typha spp.*), fiddleleaf (*Hydrolea spp.*), water primrose (*Ludwigia octovalvis*), and one spot of alligator-weed (*Alternanthera philoxeroides*).

In summary Kepler Lake is in fair to poor condition. The aquatic plants have increased as anticipated. With the exception of the upper end, all areas of Kepler Lake are accessible to fishermen and boaters.

Melvin Bagwell
WLF Sp. 4
At the time of assessment Kepler Lake was at pool stage. Water color was fair in all areas except the upper end which was very clear.

The submersed aquatic plants noted were fanwort (*Cabomba caroliniana*), Brazilian elodea (*Egeria densa*), coontail (*Ceratophyllum demersum*), bladderwort (*Utricularia* spp.), and southern naiad (*Najas guadalupensis*).

The emergent plant noted was American lotus (*Nelumbo lutea*).

In summary Kepler Lake is in fair condition. There has been no increase in aquatic plants this season and there has been some decrease in a few small areas in the upper end. The Brazilian elodea (*Egeria densa*) noted was in the area of the dam and seems to be isolated there, although in past years it has been found in infestations all over the lower portion of the lake. The severe infestations were primarily fanwort (*Cabomba caroliniana*) and bladderwort (*Utricularia* spp.). The moderate infestations were fanwort (*Cabomba caroliniana*), bladderwort (*Utricularia* spp.), coontail (*Ceratophyllum demersum*) and southern naiad (*Najas guadalupensis*).
Kepler Lake, Bienville Parish, was assessed in August, 1989. The color of the water in Kepler Lake was a turbid brown color and the lake level was at pool stage. The Secchi disc reading was thirty eight inches (38”). Kepler Lake was subject to flood water in early summer. Flood water in excess of five (5’) feet covered for a period of about four days then subsided.

The dominant plant in the upper half of Kepler Lake was fanwort (Cabomba caroliniana). Other plants noted were bladderwort (Utricularia spp.) and southern naiad (Najas guadalupensis). Small amounts of coontail (Ceratophyllum demersum) and filamentous algae were also noted.

The dominant plant in the lower half of Kepler Lake was southern naiad (Najas guadalupensis). Small amounts of Brazilian elodea (Egeria densa) were noted around the public landing and the dam area.

Above text transcribed from original document presumably written by Melvin Bagwell and corrected by James Seales, January 2012.
Kepler Lake, Bienville Parish, was assessed in August 1990. At the time of assessment Kepler Lake was 2 inches below normal. The water color was turbid brown color in the lower half of the lake and clear in the upper end.

The dominant plant in the upper half of Kepler Lake was fanwort (*Cabomba caroliniana*). Secondary plants were bladderwort (*Utricularia spp.*), Variable-leaf milfoil (*Myriophyllum heterophyllum*), and Brazilian elodea (*Egeria densa*).

The dominant plant in the lower half of Kepler Lake was bladderwort (*Utricularia spp.*). Secondary plants were fanwort (*Cabomba caroliniana*), Brazilian elodea (*Egeria densa*), and naiad (*Najas spp.*).

The emergent plants noted were American lotus (*Nelumbo lutea*), smartweed (*Polygonum spp.*), water primrose (*Ludwigia octovalvis*), cattail (*Typha spp.*) and miscellaneous grasses and sedges.

The submersed aquatic plant infestation in the upper half of the lake ranged from light to severe in the extreme end of the lake. The infestations in the lower half were light.

Above text transcribed from handwritten notes presumably written by Melvin Bagwell and corrected by James Seales, January 2012.
At the time of assessment Kepler Lake was at pool stage. The water color showed some turbidity and a fair amount of plankton. The secchi disc reading was 36 inches.

The submersed aquatic plants noted were fanwort (*Cabomba caroliniana*), coontail (*Ceratophyllum demersum*), bladderwort (*Utricularia spp.*), Variable-leaf milfoil (*Myriophyllum heterophyllum*), muskgrass (*Chara spp.*), and southern naiad (*Najas guadalupensis*).

The emersed plants noted were American lotus (*Nelumbo lutea*), fragrant water lily (*Nymphaea odorata*), cattail (*Typha spp.*), and smartweed (*Polygonum spp.*).

In summary Kepler Lake has one area of severely infested aquatic plants in the upper end and also some area of moderate infestation. The mid and lower portion of the lake have light infestations. Kepler Lake was subjected to flooding in the early spring with levels reaching 4 feet above pool stage.

Above text transcribed from original document presumably written by Melvin Bagwell and corrected by James Seales, January 2012.
At the time of assessment Kepler Lake was at pool stage. The water color was clear in most areas. There was some turbidity in the area of the dam. In most areas the Secchi disc reading was 35 inches. The lake had a fair plankton bloom.

The aquatic plants noted were fanwort (*Cabomba caroliniana*), coontail (*Ceratophyllum demersum*), bladderwort (*Utricularia spp.*), milfoil (*Myriophyllum spp.*), pondweed (*Potamogeton spp.*), naiad (*Najas spp.*), and muskgrass (*Chara spp.*).

Most infestations were light in all areas of the lake, except the extreme upper end which was moderately infested.

Submersed aquatic plants have shown some increase especially the upper end of the lake.

Above text transcribed from handwritten notes presumably written by Melvin Bagwell and corrected by James Seales, January 2012.
Kepler Lake was surveyed and assessed for aquatic plants in August, 1993.

At the time of the assessment Kepler Lake was at pool stage. The water color was very clear with no turbidity. The Secchi disc reading was 48 inches and the pH was 6.8.

The primary aquatic plant noted was fanwort (*Cabomba caroliniana*). Infestations ranged from severe in the upper end to light in other areas. Infestations were out to 7 feet deep in some areas.

The secondary plants were coontail (*Ceratophyllum demersum*), bladderwort (*Utricularia* spp.), and milfoil (*Myriophyllum* spp.). Most infestations were light or mixed with fanwort (*Cabomba caroliniana*). Brazilian elodea (*Egeria densa*) was established at the boat ramp at the dam. Brazilian elodea (*Egeria densa*) infestations were light.

American lotus (*Nelumbo lutea*) was noted at three locations in the area around Austin’s camp. The coverage of American lotus (*Nelumbo lutea*) totaled approximately three acres.

Water shield (*Brasenia schreberi*) was noted at a launch in the mid portion of the lake.

Above text transcribed from handwritten notes presumably written by Melvin Bagwell and corrected by James Seales, February 2012.
At the time of the assessment Kepler Lake was at pool stage. The water color was extremely clear. The water had some brown stains. The pH was 7.4. The Secchi disc reading at the dam was 56 inches and the reading in the upper end was 49 inches.

The submersed aquatic plants noted were fanwort (*Cabomba caroliniana*), bladderwort (*Utricularia spp.*), milfoil (*Myriophyllum spp.*), coontail (*Ceratophyllum demersum*), southern naiad (*Najas guadalupensis*), Brazilian elodea (*Egeria densa*), muskgrass (*Chara spp.*), pondweed (*Potamogeton spp.*), and filamentous algae.

The submersed aquatic plants in Kepler Lake ranged from light infestations in the lower end to moderate and severe in the upper end. There had been some increase in area and water depth into which the plants have spread. The plants were breaking at 6 feet.

Above text transcribed from handwritten notes presumably written by Melvin Bagwell and corrected by James Seales, February 2012.
At the time of the assessment Kepler Lake was at pool stage. The water was clear with no turbidity. The Secchi disc reading was 40 inches.

The submersed aquatic plants noted were fanwort (*Cabomba caroliniana*), bladderwort (*Utricularia spp.*), coontail (*Ceratophyllum demersum*), pondweed (*Potamogeton spp.*), Brazilian elodea (*Egeria densa*), and milfoil (*Myriophyllum spp.*).

The infestations of submersed plants ranged from light to moderate in most areas. There is a severe infestation in the extreme upper end.

The emersed plants noted were smartweed (*Polygonum spp.*), American lotus (*Nelumbo lutea*), water primrose (*Ludwigia octovalvis*), arrowhead (*Sagittaria spp.*), lizard’s tail (*Saururus cernuus*) and pickerel weed (*Pontederia cordata*).

Above text transcribed from handwritten notes presumably written by Melvin Bagwell and corrected by James Seales, February 2012.
At the time of the assessment, Kepler Lake was at pool stage. The water color was extremely clear. The aquatic plants surveyed were fanwort (*Cabomba caroliniana*), milfoil (*Myriophyllum spp.*), muskgrass (*Chara spp.*), filamentous algae, spikerush (*Eleocharis spp.*), and coontail (*Ceratophyllum demersum*). The floating and emersed plants noted were American lotus (*Nelumbo lutea*), bulrush (*Scirpus spp.*), fragrant water lily (*Nymphaea odorata*), Water shield (*Brasenia schreberi*), water hyssop (*Bacopa spp.*), water primrose (*Ludwigia octovalvis*), lizard’s tail (*Saururus cernuus*), and pickerel weed (*Pontederia cordata*).

The distribution of aquatic plants in Kepler Lake was moderate in the extreme upper end to very light in all other areas. The total infestation was an estimated 10%.

Above text transcribed from original document and corrected by James Seales, January 2012.

Kepler Lake – Aquatic Vegetation Type Map and Narrative – 1999

Kepler Lake 1999 Melvin
Bagwell

At the time of the assessment, Kepler Lake was at pool stage. The water color was clear.

The submersed aquatic plants noted were southern naiad (*Najas guadalupensis*), fanwort (*Cabomba caroliniana*), milfoil (*Myriophyllum spp.*), coontail (*Ceratophyllum demersum*), and bladderwort (*Utricularia spp.*). The emersed aquatic plants noted were smartweed (*Polygonum spp.*), water hyssop, (*Bacopa spp.*), cattail (*Typha spp.*), water primrose (*Ludwigia octovalvis*), and American lotus (*Nelumbo lutea*).

The infestations of submersed aquatic plants were light in all areas except the extreme upper end which was moderate to severe. The emersed aquatic plants were marginal and light in infestation.

Above text transcribed from original document and corrected by James Seales, January 2012.
Kepler Lake – Aquatic Vegetation Type Map and Narrative – 2000

Kepler Lake August 2000  
Melvin Bagwell

At the time of the assessment Kepler Lake was at pool stage. The water color was clear.

The submersed aquatic plants noted were fanwort (*Cabomba caroliniana*), milfoil (*Myriophyllum spp.*), bladderwort (*Utricularia spp.*), coontail (*Ceratophyllum demersum*), muskgrass (*Chara spp.*), southern naiad (*Najas guadalupensis*), pondweed (*Potamogeton spp.*), and filamentous algae.

The emersed aquatic plants noted were American lotus (*Nelumbo lutea*), fragrant water lily (*Nymphaea odorata*), water pennywort (*Hydrocotyle umbellata*) water primrose (*Ludwigia octovalvis*) and water shield (*Brasenia schreberi*).

The estimated percentage of infestation was 10 percent.

Above text corrected by James Seales, February 2012.
Kepler Lake was surveyed for the presence of aquatic vegetation on July 24, 2001. At the time of the survey the lake was at pool stage. The water color was clear.

The submersed plants noted were: fanwort (Cabomba caroliniana), coontail (Ceratophyllum demersum), bladderwort (Utricularia spp.), milfoil (Myriophyllum spp.), spikerush (Eleocharis spp.), muskgrass (Chara spp.) and filamentous algae.

The emersed plants noted were: American lotus (Nelumbo lutea), fragrant water lily (Nymphaea odorata) waterhyssop (Bacopa spp.), bulrush (Scirpus spp.), and watershield (Brasenia schreberi).

The estimated percent coverage of submersed plants was 25%.

Above text corrected by James Seales, February 2012.
Kepler Lake – Aquatic Vegetation Type Map and Narrative – 2009

A vegetation type map survey was performed in May of 2009. Coverage of submerged aquatic vegetation was approximately 500 acres, and emergent vegetation covered approximately 50 acres. The submerged vegetation consisted of 90% milfoil (Myriophyllum spp.), 5% fanwort (Cabomba caroliniana), 3% American lotus (Nelumbo lutea), and 2% mixture of other species.

Above text assimilated from information in e-mail from John White.

Kepler Lake – Typemap Survey – April 2009
South End
Kepler Lake was surveyed on June 12, 2014 by Jeff Sibley and Kevin Houston. The lake was a few inches over pool stage, and the water was clear. The survey was conducted just prior to the scheduled drawdown date of June 15, 2014.

**North of the Parish Road 676 bridge**-- A band of emergent watershield (*Brasenia schreberi*) and waterlily (*Nymphaea odorata*) was present in a 30-50 foot wide swath along the bankline. Beyond the band of vegetation, the lake was very open; however, below the surface, submerged aquatic vegetation (SAV) was concentrated in the water column to within 2 feet of the surface. These concentrations of SAV were found growing out to the eight foot contour line. The SAV noted in this portion of the lake was variable leaf milfoil (*Myriophyllum heterophyllum*), eurasian milfoil (*Myriphyllum spicatum*), fanwort (*Cobomba caroliniana*), and bladderwort (*Utricularia* spp.). Milfoil comprised 70% of the total, and the other species listed filled in the remaining 30%. The northernmost portion of the lake (approx. 200 acres) was covered by a dense mat of emergent and submerged vegetation. A few primary stage plants of giant salvinia were present near JJ’s ramp adjacent to Parish Road 676. Total acreages of severe and moderate coverage were 380 acres and 340 acres respectively.

**South of the Parish Road 676 Bridge**-- A band of watershield (*Brasenia schreberi*), American lotus (*Nelumbo lutea*), watergrass (*Luziola fluitans*), and waterlily (*Nymphaea odorata*) was present along the bank in a 10 – 20 ft. swath. Once again, submerged vegetation was present out to the eight foot contour line; however, the concentration of SAV below the bridge was less dense than above the bridge. This decline in SAV density is likely due to increased wave action. The SAV noted south of the bridge included bladderwort (*Utricularia* spp.), fanwort (*Cobomba caroliniana*), hydrilla (*Hydrilla verticillata*), elodea (*Elodea Canadensis*), southern naiad (*Najas guadalupensis*), and eurasian milfoil (*Myriphyllum spicatum*). A few ramets of giant salvinia (*Salvinia molesta*) were scattered on the southern portion of the lake. Total acreages of severe, moderate, and light coverage were 22, 35, and 420 acres respectively.
Kepler Lake Aquatic Vegetation Typemap for 2014
Introduction
An aquatic vegetation typemap survey was performed on Kepler Creek Reservoir in Bienville Parish on August 18, 2015. The survey was conducted by Inland Fisheries Biologist James Seales. The lake was approximately three inches below pool stage at the time of the survey. The water color was stained.

Vegetation Observed

Marginal Vegetation
Marginal aquatic vegetation was observed along significant areas of the shoreline of the lake. The predominate species was torpedo grass (Panicum repens) which covered large areas of the shoreline. Clumps of wild taro (Colocasia esculenta) were widely scattered around the shoreline. Bulrush (Scirpus spp.) and fiddleleaf (Hydrolea spp.) were also found in a few locations.

Emergent Vegetation
Fragrant water lily (Nymphaea odorata) was the prominent species of emergent vegetation found on Kepler Lake. The density of fragrant water lily ranged from widely scattered in some areas to dense coverage in areas of severe infestation. Creeping water primrose (Ludwigia repens), alligator weed (Alternanthera philoxeroides), pondweed (Potamogeton spp.), southern watergrass (Luziola fluitans), baby-tears (Micranthemum umbrosum) and American lotus (Nelumbo lutea) were found in a few locations on the lake. Most of the emergent vegetation was found in the back of the coves and on the upper end of the lake in water less than 3 ft. deep. A few patches of fragrant water lily were found in 5 to 6 ft. of water.

Submersed Vegetation
Submersed aquatic vegetation (SAV) was scattered in the shoreline areas out to 7 ft. deep. Coverage was sparse in most areas at the time of the survey. The major species were widgeon grass (Ruppia maritima) and bladderwort (Utricularia spp.). Slender spike rush (Eleocharis baldwini) was seen along the shoreline. Muskglass (Chara spp.), naiad (Najas spp.), fanwort (Cabomba caroliniana), and variable-leaf milfoil (Myriophyllum heterophyllum) were observed in a couple of locations in the lake. The SAV was not topped out in any location visited and was found to be growing only 1 – 2 ft. or less up off of the lake bed in most areas. Approximately 25% of the lake had a light coverage of this mixture of SAV.

Floating Vegetation
Giant salvinia (Salvinia molesta) was found in a couple of areas on the lake as was duckweed (Lemma spp.). Neither plant was problematic at the time of the survey, but giant salvinia has the potential to become a major problem on Kepler Lake.
Summary
Kepler Creek Reservoir underwent a drawdown from June 15, 2014 through the end of November 2014. Vegetation coverage was greatly reduced following this drawdown. Currently the only area on the lake where vegetation is problematic is the extreme upper end of the lake. Currently, SAV is present out to the 7 ft. contour, but coverage is sparse in most areas and it is not problematic at this time. Currently coverage of emergent vegetation is approximately 364 acres (18.9%). Light coverage of emergent vegetation is found on approximately 130 acres, moderate coverage on 111 acres and severe coverage is found on 123 acres. Approximately 480 acres (25%) of the lake has light coverage of submerged vegetation.

Vegetation Concerns
Giant salvinia (*Salvinia molesta*) was discovered on Kepler Creek Reservoir in 2009. Foliar herbicide applications have been ongoing as needed since the plant was discovered. The lake should be monitored for the presence of giant salvinia and additional herbicide applications made as necessary. Even though vegetation coverage was greatly reduced during the drawdown last year, significant levels of vegetation remain and will likely increase in coverage in future years. Two thousand triploid grass carp were stocked by the Kepler Creek Recreation and Water Conservation District Commission (KCRWCD) in 2009 and an additional 1,500 by LDWF in 2013. The lake should be monitored to determine if additional grass carp are needed to control the submerged aquatic vegetation that has historically been problematic in Kepler Lake.
